List of Annexes

Annex 1: List of abbreviations	43
Annex 2: Technical description of the data set for data transmission (FM)	

1 Fundamentals

This document contains information on the submission of MiKaDiv FM reports in XML format to the Federal Central Tax Office (BZSt). This comprises a description of the interface definition, which is provided as an XML Schema (XSD). Further information on this can be found in Annex 2, “Technical description of the data set for data transmission (FM)”.

1.1 Legal basis

Financial institutions which – under Sections 43 et seq. EStG – are obligated to withhold capital income tax must, pursuant to Section 45b EStG, provide the BZSt with creditor-related data on certified capital income within the meaning of Section 43 (1) Sentence 1 No. 1a, and (2) Sentence 4 EStG – hereinafter: capital income.

In the case of creditors subject to unlimited tax liability, the issuer of the tax certificate must submit the report by 31 March¹ of the calendar year following the receipt of the capital income at the latest (Section 45b [4] EStG). The paying agent must notify creditors with limited tax liability without delay upon their request (Section 45b [5] EStG).

The BZSt must also be provided by the paying agents with information regarding the securities account holder (where known, or, alternatively, the recipient of the capital income) and the capital income itself, even if no tax certificate has been issued or no data set has been transmitted in accordance with Section 45b (5) EStG (Section 45b [6] Sentence 1 EStG). In the event of an abstention, information must be provided regarding the nature and extent of the abstention of tax deduction and the amount of capital income tax withheld and remitted (Section 45b [6] Sentence 2 EStG). In accordance with Section 45b (6) Sentence 4 EStG, these reports must be submitted to the BZSt by 30 April² of the calendar year following the receipt of the capital income.

In addition, thereto, pursuant to Section 45c EStG, by no later than 31 July of the calendar year following the receipt of the capital income, collective reports must be submitted, among other things, for all classes of shares regarding the total amount of dividends distributed, the taxation

¹ No-objection rule for submissions until 31.05. (see margin note 84 of the Federal Ministry of Finance circular of 22 April 2025 “Individual questions relating to data transmission in accordance with sections 45b and 45c EStG)

² No-objection rule for submissions until 30.06. (see margin note 84 of the Federal Ministry of Finance circular of 22 April 2025 “Individual questions relating to data transmission in accordance with Sections 45b and 45c EStG)

performed (or any abstention thereof), as well as information on compensation payments.

The jurisdiction of the BZSt is derived from Section 4 (2) and Section 5 (1) No. 14a Financial Administration Act (FVG) in conjunction with Sections 45b and 45c EStG.

1.2 Copyright

This (technical) documentation is intended to provide information to those involved in the MiKaDiv procedure. Further publication, reprinting, reproduction or storage – in any form whatsoever, in whole or in part – is permitted only with the prior written consent of the BZSt.

The reproduction of common names, trade names, trade marks, etc. in the documents does not – even in the absence of any specific indication – imply that such names are to be regarded as free within the meaning of trade mark and brand protection legislation and may, therefore, be used by anyone. All brand names and product names are trademarks or registered trademarks of their respective owners.

1.3 Fundamentals of bulk data transmission using DIP

All the basic principles governing the transmission of MiKaDiv FM reports via DIP are set out in the “Communication DIP Standard”, which can be downloaded from the BZSt website.

The target procedure for data transmission via DIP is: “MIKADIVFM”.

The version of the specialized procedure adapter is V3.0, and the version of the DIP interface is 2.1.

The “Communication DIP Standard” contains information on the following topics:

- Technical requirements
- Activation and authentication
- Data transfer and the creation of digital signatures
- Processing logs
- Structure of notifications

2 General information about XSD design

The legislation requires a large amount of information to be submitted as part of the MiKaDiv procedure. The combination of the number of possible security classes, detailed information on payment dates, and additions to and disposals of security positions means that the file size of a MiKaDiv FM message can vary considerably.

In order to enable the rapid and, above all, robust generation, transmission and processing of MiKaDiv FM messages by all parties involved, the decision was made during the MiKaDiv-FM-XSD design process to move away from a generic XSD structure and instead adopt a case-specific structure comprising reports that contain only reports of the same report type. This allows for a more precise definition of mandatory fields and more effective control over file size. Having more rules in the XSD (rather than in a backend procedure) also allows MiKaDiv users to perform further checks before sending. Simultaneously, this avoids the burden and time wasted on sending and checking an erroneous message.

It was also decided to separate the detailed information on additions and disposals from the other data in a report, and to transmit this information using a specific report type for supplementary details.

The following sections of this chapter describe various conceptual aspects and structures of the MiKaDiv-FM-XSD.

2.1 Report hierarchy

The transmission procedure for MiKaDiv FM reports generally distinguishes between independent reports and reports containing additional information (ZAM). Both report types can be uniquely identified by means of a technical UUID. This technical UUID is also used for identification purposes in support enquiries.

While the content of an independent report may be valid in its own right from a technical perspective, this is never the case with reports containing additional information (ZAM). Its technical content is only valid when used in conjunction with an independent report. Such reports, therefore, do not require any other specialist or technical data (see chapter 2.4).

An independent report may be either a report relating to capital income with (independent report with serial number – report type 11) or without a tax certificate (report type 13), or a report under Section 45c EStG.

A cancellation report is a report of an informative nature. This is used to indicate that a previously submitted report should never have been sent (report type: cancellation).

The diagram below illustrates the structure of this concept.

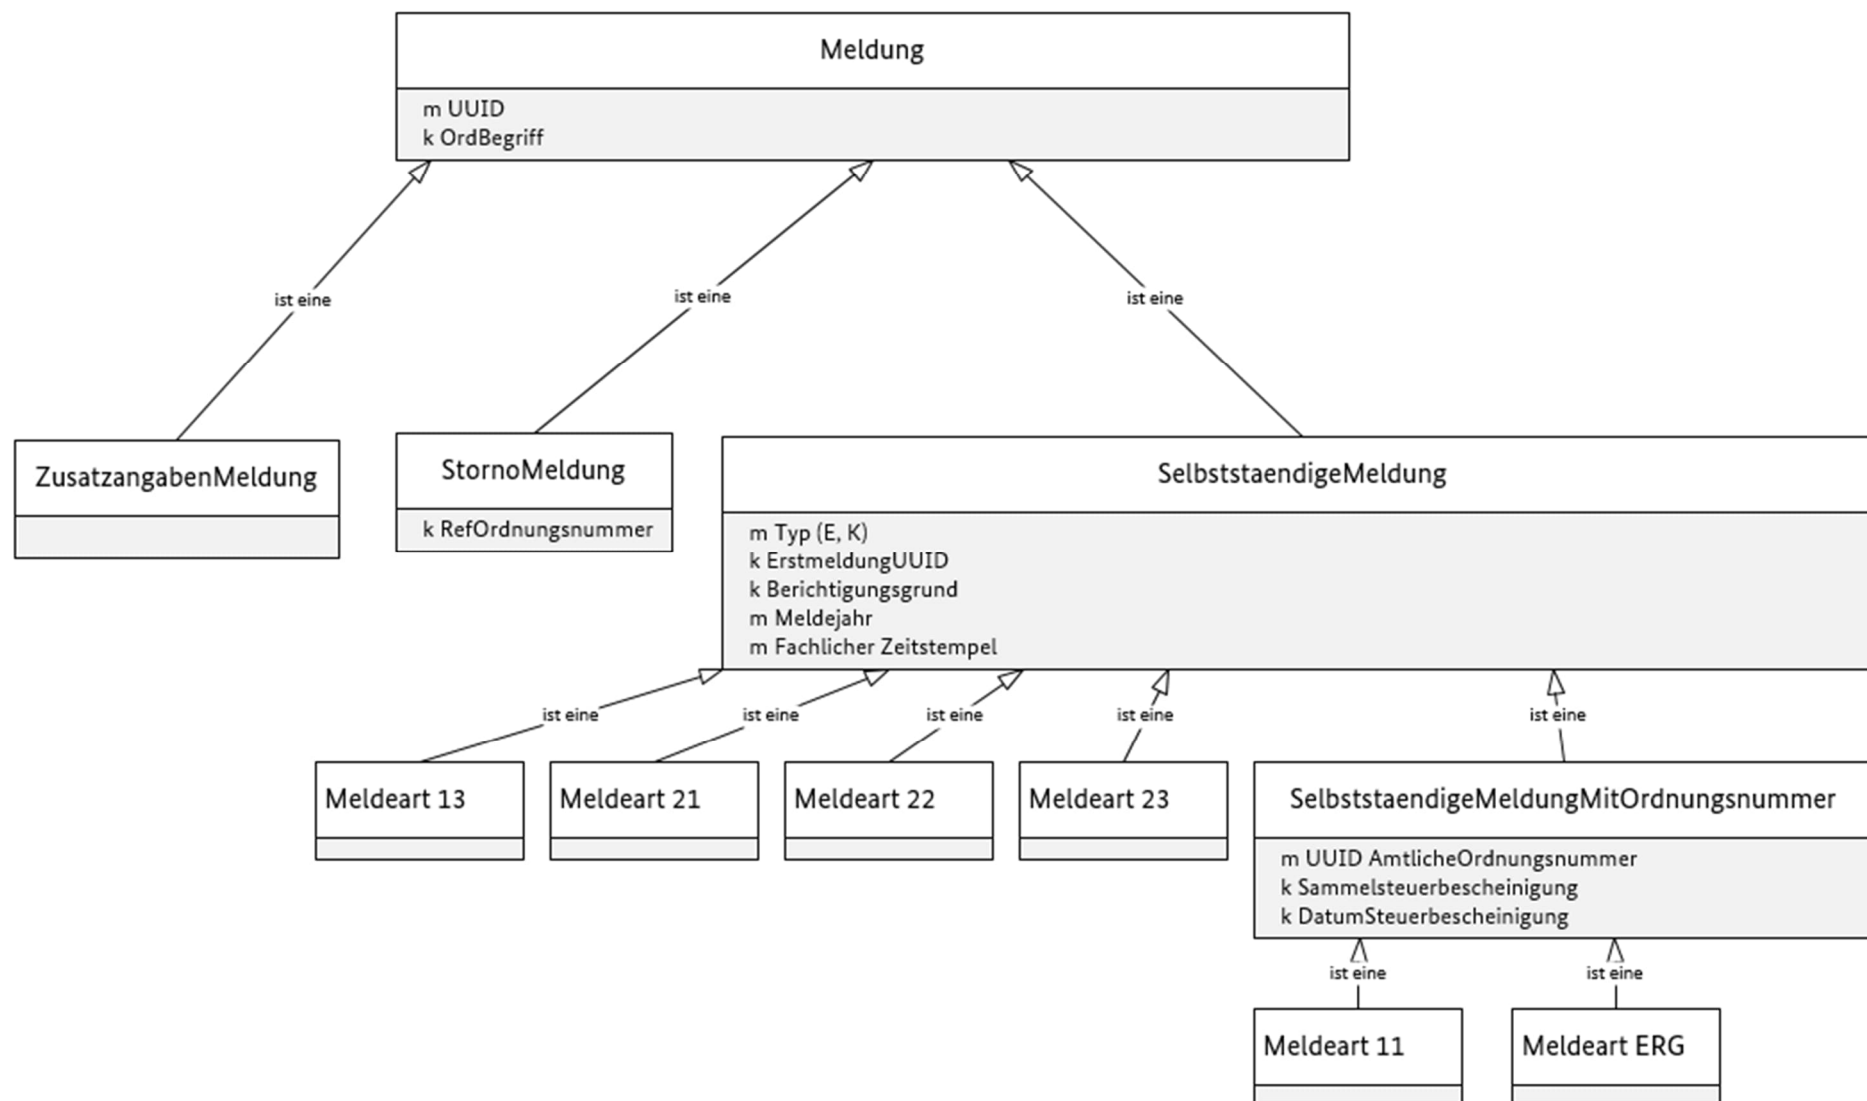

Figure 1: Conceptual hierarchy of reports

2.2 Message content

MiKaDiv FM messages contain only reports of the same type. This allows the maximum file size and number of reports per message to be determined more precisely.

The diagram below illustrates the concept. It shows that a message contains exactly one report list.

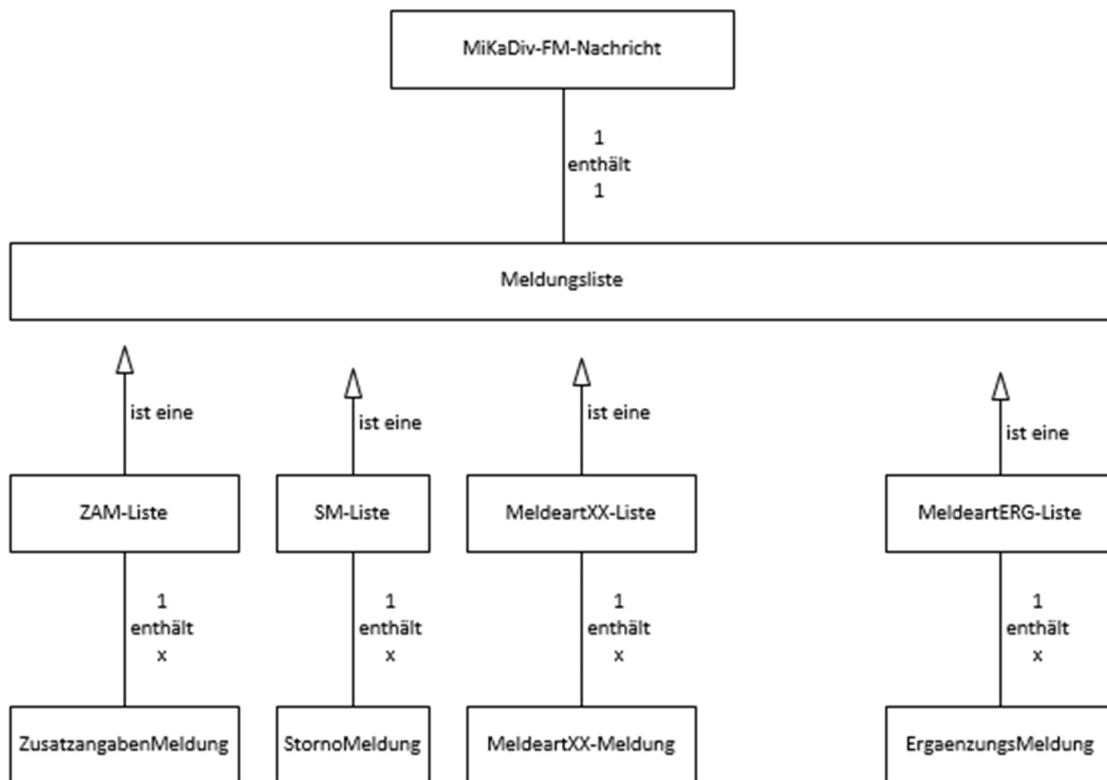

Figure 2: Conceptual content of a message

The response messages already make it clear as to whether the message contains a cross-record error or whether the individual reports could be validated.

Detailed information can be found in chapter 9.

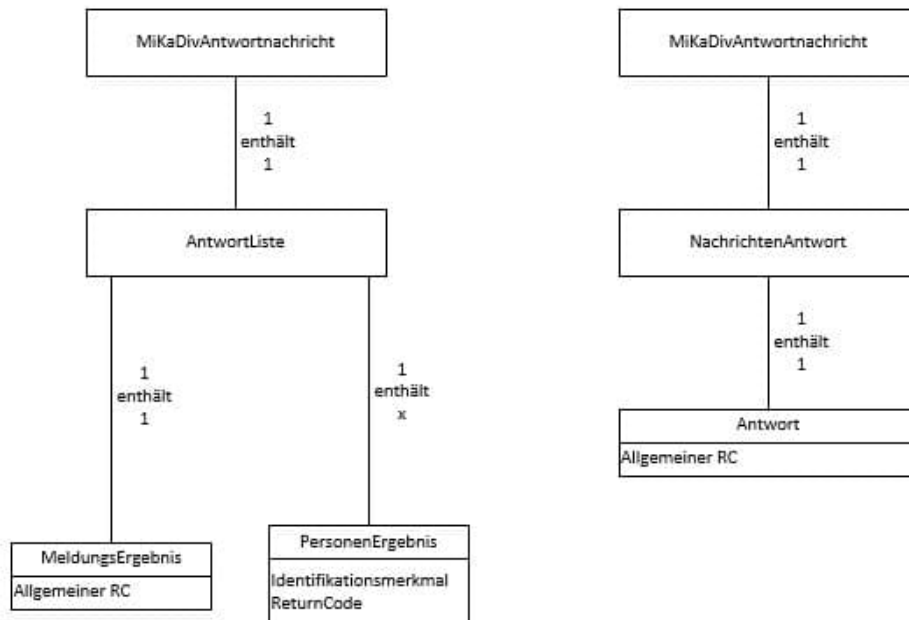

Figure 3: Conceptual content of a response message

2.2.1 Maximum message size

The size of the message to be sent must not exceed 200 MB.

2.3 Report content

The content of a report depends on whether it is an independent report or a report containing additional information (ZAM).

2.3.1 (Independent) report

Independent reports must contain not only technical details (e.g. identifying UUID and report type) and basic business data (e.g. reporting year and the timestamp), but also details of the account holders involved (e.g. creditor or representatives), capital income generated per security class and payment date, and much more.

This does not apply to cancellation reports.

The diagram below provides a schematic overview of the contents of an independent report, using the example of a report with an issued tax certificate (report type 11).

No details of additions and disposals are provided as at the payment date for this class of securities. Instead, the unique UUID of the report containing additional information (ZAM) is provided here.

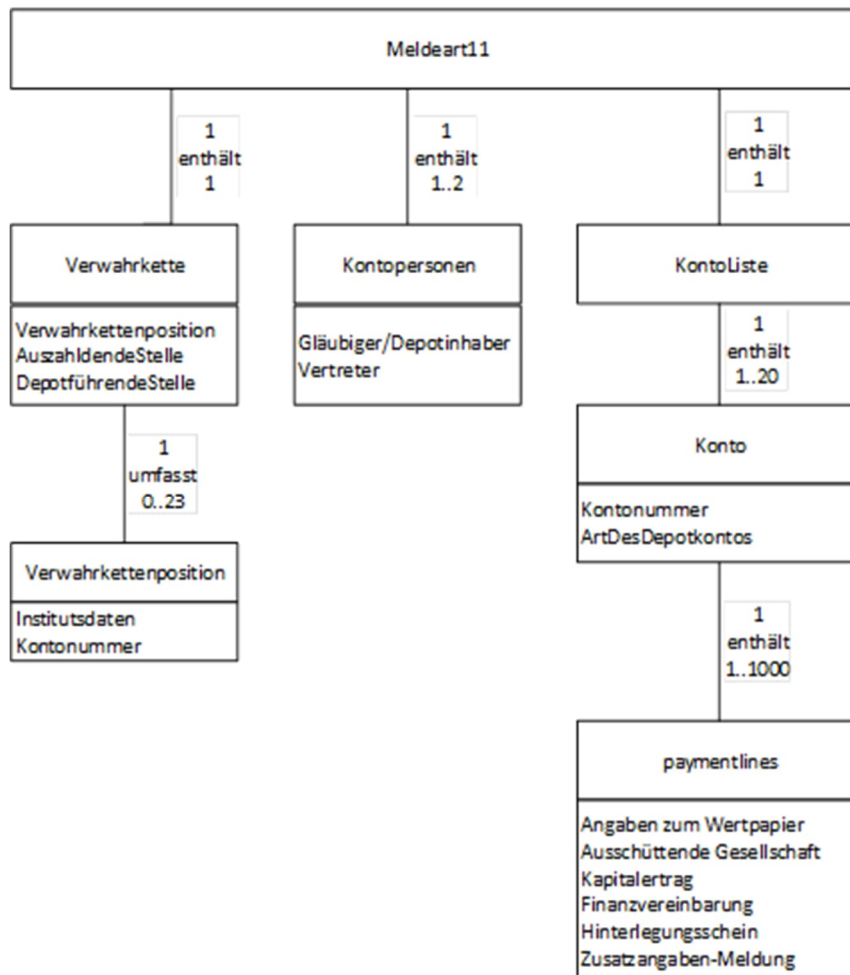

Figure 4: Conceptual structure of an independent report (using MA11 as an example)

2.3.2 Report containing additional information (ZAM)

The detailed information on additions and disposals for a specific payment date for a class of securities is not listed directly in an independent report. That is what a report containing additional information (ZAM) is for.

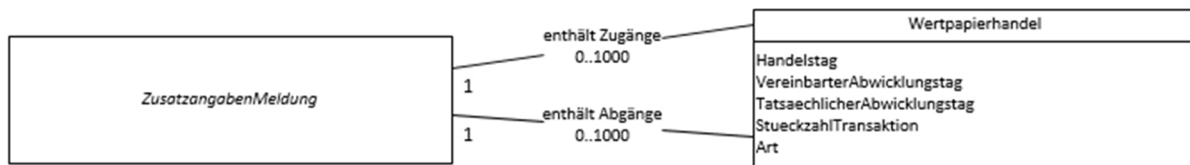

Figure 5: Conceptual content of reports containing additional information (ZAM)

Another distinctive feature of a report containing additional information (ZAM) is that it does not itself contain any further technical details (e.g. timestamp, reporting year or official serial number). This allows it to be used in several independent reports and facilitates the correction procedure.

If, for example, the reported capital income in an independent report is incorrect, the system allows the report containing additional information (ZAM) (which is already known to the system) to be referenced again on the payment date, meaning that its contents do not need to be resubmitted.

A report containing additional information (ZAM) must be submitted before the independent report to which it refers.

2.4 Consolidation of reports

In order to merge an independent report with a report containing additional information (ZAM), it is possible to specify the identifying UUID of the report containing additional information (ZAM) on the relevant payment date (for a security class).

When processing an independent report, the system now checks whether there is an accepted, valid report containing additional information (ZAM) in the system for each of these references.

If no accepted, valid report containing additional information (ZAM) with this reference is found during the verification of the independent report, the independent report is initially put on hold and resubmitted for processing after a few days. If no suitable report containing additional information (ZAM) is found during the reprocessing, the independent report will be definitively rejected. This procedure is, therefore, similar to the procedure for (initial) cancellation reports, where a check is performed during processing to determine whether a cancellable report exists.

3 Report file

A report file, which is to be transmitted via the mass data interface, consists of:

- DIP cover (“Umschlag”) (see chapter 1.3)
- MiKaDivFMRoot for summarising procedure-specific user data (reports or responses), each with
 - MiKaDiv user details
 - List of reports or responses

3.1 Structure

3.1.1 MiKaDivFMRoot

MiKaDivFMRoot groups the MiKaDiv user’s payload or the resulting response from the BZSt. It serves as a procedure-specific interface to the DIP cover (“Umschlag”).

This ensures that no more than one piece of identifying information in a message is marked with the same UUID, and that no more than one MiKaDiv user uses the same process-specific registration number.

3.1.2 MiKaDiv_FM_45b and MiKaDiv_FM_45c

MiKaDiv_FM_45b and MiKaDiv_FM_45c represent the root nodes for MiKaDiv FM reports. They contain references to the MiKaDiv user. They also contain a list of reports (see chapter 3.1.5) of all reports for the specific report types.

3.1.3 Certified financial intermediary³ or reporting entity

The details provided by a certified financial intermediary or reporting entity contain the details of the entity required to submit the report. These details are mandatory.

In addition to the personal details of the entity required to submit the report, an address and a contact person must always be provided.

³ Based on COUNCIL DIRECTIVE (EU) 2025/50 of 10 December 2024 on faster and more secure relief from excess withholding tax (FASTER Directive)

3.1.4 Service providers

A service provider is a non-natural person that submits the report on behalf of an entity required to submit the report.

The details of a service provider are optional and need only be provided if the report is submitted by a service provider.

Its structure essentially corresponds to the details of the certified financial intermediary or reporting entity.

3.1.5 MeldungListe45b and MeldungListe45c

Meldungsliste45b and MeldungsListe45c contain the individual reports. The report lists for the specific report types are derived from these. The types of individual reports are described in chapter 4.

3.2 Succession

Succession in a legal relationship can be triggered by various circumstances, including amongst others mergers, demergers and spin-offs. The following are four examples of situations that give rise to legal succession.

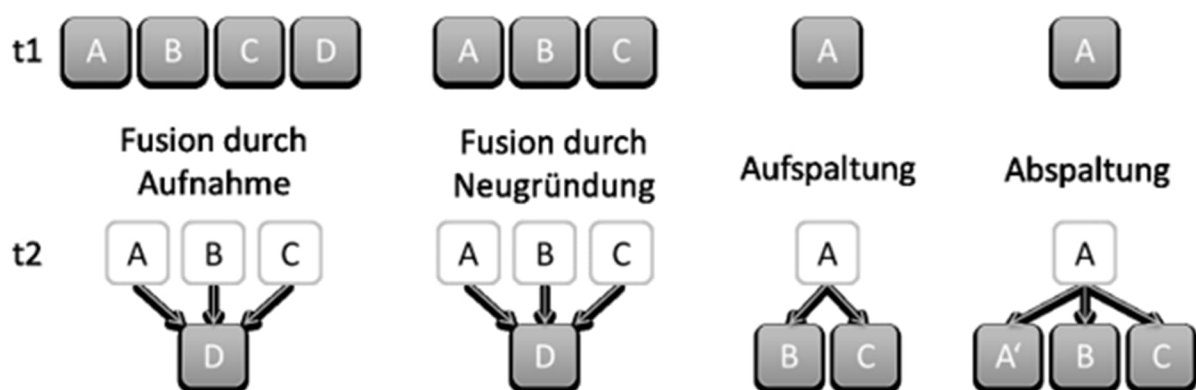

Figure 6: Example of legal succession

What all these scenarios have in common is that, at a point in time t_1 , one or more companies exist which, at a later point in time t_2 , enter into a legal succession with one or more companies.

From the date of succession, any reports (in particular, corrections and cancellations) must be performed by the successor on behalf of the predecessor. As was the case prior to the succession, the details (including the process-specific registration number!) of the predecessor must be provided with certified financial intermediary or reporting entity. If a service provider is responsible for transmitting the reports, the service provider must also be used.

However, the name should be supplemented with a reference to the legal successor.

Examples of the name of the entity subject to reporting requirements (legal predecessor):

- bank V (legal successor: bank R)
- bank R as legal successor to bank V

4 Report

A report contains the relevant details of a specific matter.

4.1 General structure

This chapter explains the general structure of a report. The chapter serves as the basis for the subject-specific report types (see chapter 4.2). The conceptual foundations were already explained in chapter 2.

4.1.1 Report

Each report contains an UUID for unique technical identification. A report can be supplemented with a classification term. This can be chosen freely (e.g. an internal number or a characteristic) and is used by the MiKaDiv user for assignment.

4.1.2 Independent report

The independent report contains further details in addition to the information listed in chapter 4.1.1. The report type indicates whether it is an initial report (E) or a correction report (K).

If a report needs to be corrected, the technical UUID of the original report (“ErstmeldungUUID”) must also be included in the report. Furthermore, a reason for the correction can be entered when making a correction.

The reporting year is the year for which the report is being submitted, and must not be in the future. Reports spanning multiple years are not permitted.

4.1.3 Independent report with official serial number

The independent report with an official serial number supplements the independent report by requiring the inclusion of an official serial number in accordance with Section 45b (1) EStG. The content and structure of the official serial number are set out in paragraph 2 of the Federal Ministry of Finance circular of 16 May 2025 concerning the issue of tax certificates pursuant to Section 45a (2) and (3) EStG.

Furthermore, for tax residents, the date of the tax certificate and the amount of tax stated therein must be provided.

If the tax certificate provided in the report is based on a collective tax certificate, the report must be marked accordingly (see margin note 72 of the Federal Ministry of Finance circular of 16 May 2025 concerning the issue of tax certificates pursuant to Section 45a [2] and [3] EStG.)

In the case of supplementary tax certificates, the tax certificate to be supplemented is decisive: if the tax certificate for the original report is based on a collective tax certificate, all tax certificates supplementing this tax certificate must also be marked accordingly.

4.1.4 Cancellation report

A cancellation report allows a submitted report that should never have been sent to be cancelled without the need to specify the entire content of the user data.

If a report must be cancelled, the technical UUID of the original report (“ErstmeldungUUID”), as well as the official serial number (in cases where a tax certificate has been issued or a request has

been made: “RefOrdnungsnummer”) must be included in the report.

4.1.5 Report containing additional information

A report containing additional information (ZAM) defines additional information relating to an independent report and contains details of securities purchased and/or sold.

All reports containing additional information allow to specify additions or removals as an option.

4.2 Types of reports

The specific report types are all derived from one of the report types described in the previous chapter and supplement these with their respective specific details. These are usually the account holders and security classes, including payment date details.

4.2.1 Report type 11

In cases where a tax certificate has been issued or a request for data transmission has been made (Section 45b [4] or [5] in conjunction with [2] and [6] Sentence 2 EStG), a report of report type 11 (independent report with official serial number) must be submitted.

In addition to the official serial number, the reporting format requires details of the custody chain, the account holder (creditor/securities account holder and, where applicable, their representative) and the relevant account.

The account number and the type of securities account must be clearly stated.

The account is accompanied by the relevant details regarding the ISIN and the payment date, further securities-related information, as well as capital income, details of financial arrangements and, where applicable, depositary receipts (known as the ‘paymentline’).

Up to 20 accounts, each with up to 1,000 paymentlines, can be reported in a single report for an account holder subject to unlimited tax liability. In the case of taxpayers with limited tax liability, only one paymentline per report is permitted (section 45b (5) EStG).

Within the paymentline, it is also possible to indicate the application of the “no-objection” rule regarding the second tax withholding for depositary receipts, as set out in margin note 70 of the

Federal Ministry of Finance circular of 22 April 2025 addressing individual questions relating to data transmission in accordance with Sections 45b and 45c EStG. In such cases, no information pursuant to Section 45b (2) No. 6 EStG is required to be provided for the second tax withholding by the domestic custodian.

Where details of additions and disposals are required, the UUID of the report containing additional information (ZAM) must be referenced in the relevant paymentline.

If the actual number of additions or disposals exceeds the maximum number that can be entered (up to 1,000 additions and up to 1,000 disposals), this must be indicated accordingly.

Additions should be listed in chronological order, starting with the most recent and ending with the oldest. The disposals should be listed in order from the oldest to the youngest.

The relevant point in time for this is when the report is submitted.

The following figure illustrates the details of additions and disposals. The red dot corresponds to the point in time being viewed.

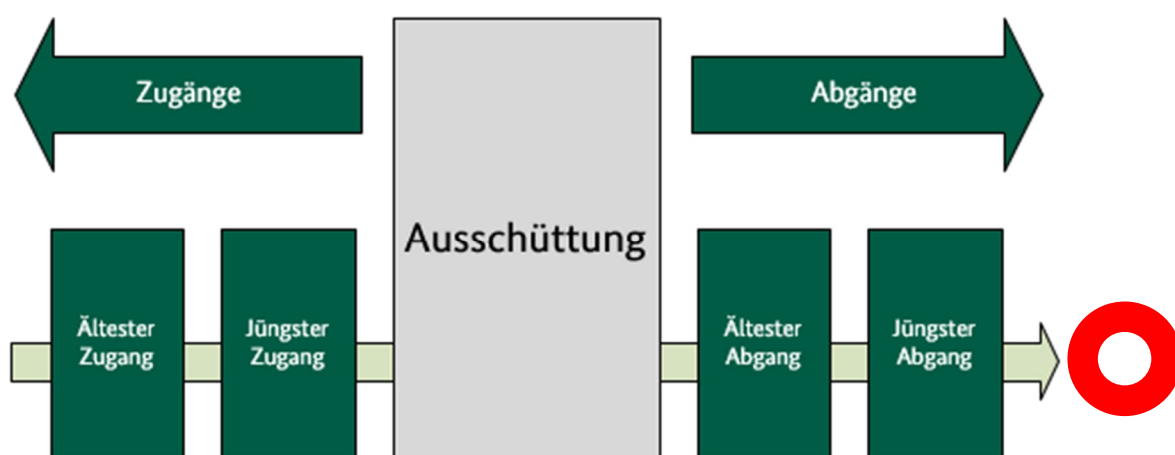

Figure 7: Example of additions and disposals

In addition to other optional details, the number of transactions, the trading day, the agreed settlement date and the actual settlement date must be provided.

4.2.2 Report type 13

In cases where no tax certificate has been issued or no request for data transmission has been made (Section 45b (6) Sentences 1 and 2 EStG), a report of type 13 (independent report) must be submitted.

The report is structured in the same way as report type 11. The restrictions on the scope of paymentlines for taxpayers with limited tax liability do not apply here. Under Section 45b (6) Sentence 1 EStG, the details of at least one securities account holder must be provided; alternatively, the details of a creditor may be provided, if known.

The details regarding the custody chain, financial arrangements and, where applicable, depositary receipts are required under report type 13 only in cases of abstention pursuant to Section 45b (6) Sentence 2 EStG.

4.2.3 Report type 21

For summary reports on income in accordance with Section 45c (1) EStG, a report of type 21 (independent report) must be submitted.

Each report of this type relates to a class of securities (name and ISIN) and contains a summary of its income for each payment date. Compared to other report types, there is, therefore, no information whatsoever on account holders. Up to 4 unique payment dates can be reported per ISIN.

Income is reported depending on whether tax has been withheld, partially withheld and/or hasn't been withheld. In this context, the income must be grouped by legal basis and an entry made in the relevant list (no abstention [OhneAbstand], partial abstention [TeilAbstand], full abstention [VollAbstand]).

While there may be only one "no abstention" ("OhneAbstand") entry, there be up to 30 entries each of partial or full abstention.

4.2.4 Report type 22

For reports on securities account income in accordance with Section 45c (2) Sentences 1 and 2 EStG, a report of report type 22 (independent report) must be submitted.

The report is structured in the same way as report type 11, but requires at least one securities account holder to be specified; alternatively, a creditor may be specified if known.

Up to 1,000 paymentlines can be submitted per report for each account holder. In addition to providing the ISIN and the payment date, all required information relating to a securities account must be provided.

4.2.5 Report type 23

For the summary report pursuant to Section 45c (2) Sentence 3 EStG, a report of report type 23 (independent report) must be submitted. This is transmitted exclusively by the domestic central securities depository.

In addition to the total amount of capital income tax paid in accordance with Section 44 (1a) EStG, the report contains a list of up to 3,000 official serial numbers for reports submitted in accordance with Section 45b EStG.

4.2.6 Report type Supplement (Ergänzung)

To submit supplementary tax certificates, a report of the type “Ergänzung” (supplement) independent report with an official serial number must be submitted.

Supplementary tax certificates may only be used if the capital income and the deductible capital income tax have been stated as too low (see margin note 6 of the Federal Ministry of Finance circular of 16 May 2025 concerning the issue of tax certificates pursuant to Section 45a [2] and [3] EStG). They are used to notify the BZSt of any discrepancies in the amounts reported.

In the case of creditors subject to limited tax liability, the transmission of data replaces the certificate required under Section 45a (2) Sentence 1 EStG.

The report must always refer to the official serial number of the tax certificate or data report to be supplemented.

The report is structured in the same way as report type 11.

4.3 Correction, cancellation of or addition to a report

When correcting, cancelling or adding to a report, the following attributes generally play a crucial role:

- The report type
- The reporting year
- The timestamp
- The referenced original report
- The referenced data report to be supplemented

There may be only one original report (ErstMeldung; type “E”) per reporting year for any given set of facts. If it is found that the original report contains inaccuracies, a correction report (KorrekturMeldung; type “K”) must be submitted. A correction report may be followed by any number of further correction reports in this case. Each correction report replaces the referenced original report (as well as any previous corrections) in its entirety. **Do not** cancel before making a correction.

A cancellation report (StornoMeldung; type ‘S’) may only be used if one (or more) report(s) has/have been submitted for a matter for which no report should have been submitted.

A cancellation report, therefore, applies to all previous reports for the same reporting year relating to the case in question. This means that both the original report and any correction reports or additions are cancelled and classified as irrelevant by the entity required to submit the report. If, following a cancellation, it is determined that a notification should have been made after all, the report chain must be restarted with an original report.

The lifecycle of a data report (for a specific event) thus extends from the original report to its cancellation. Correction, cancellation or additional reports outside the lifecycle are not possible.

Correction, cancellation and supplementary reports use the “ErstmeldungUUID” to reference the original report to be corrected, cancelled or supplemented. To avoid the phenomenon of messages being overtaken, where the report is processed before the previous one has been delivered, the “Zeitstempel” (timestamp) plays a crucial role. The entity required to submit the report uses the “Zeitstempel” to indicate the specific point in time to which the report relates.

This timestamp is used to arrange the reports in chronological order.

Note: If the system receives a correction, cancellation or supplementary report whose reference has not yet been processed by the system, the report is placed on hold for up to ten days. If, within this period, a report is received with a timestamp that is older than that of the correction/cancellation/supplementary report, the report is processed first, followed by the processing of the pending report. If no such response is received, the pending report is finally rejected with the general return code 03.

In the case of a supplementary report, the original data report remains valid. The official serial number of the underlying tax certificate or the underlying officially transmitted data set (= “RefOrdnungsnummer”) must always state – irrespective of whether a correction has been made in the meantime.

Each supplementary report is an independent data report and is, therefore, valid in its own right. Consequently, it can be amended or cancelled on an individual basis. For this reason, the “ErstMeldungUUID” and the report type (E, K, S) in supplementary reports always refer to the lifecycle of that supplementary report and not to the lifecycle of the report being supplemented.

4.3.1 Example: Corrections, cancellations, additions

The following diagram illustrates, by way of example, a report that is corrected (and supplemented) multiple times during its lifecycle.

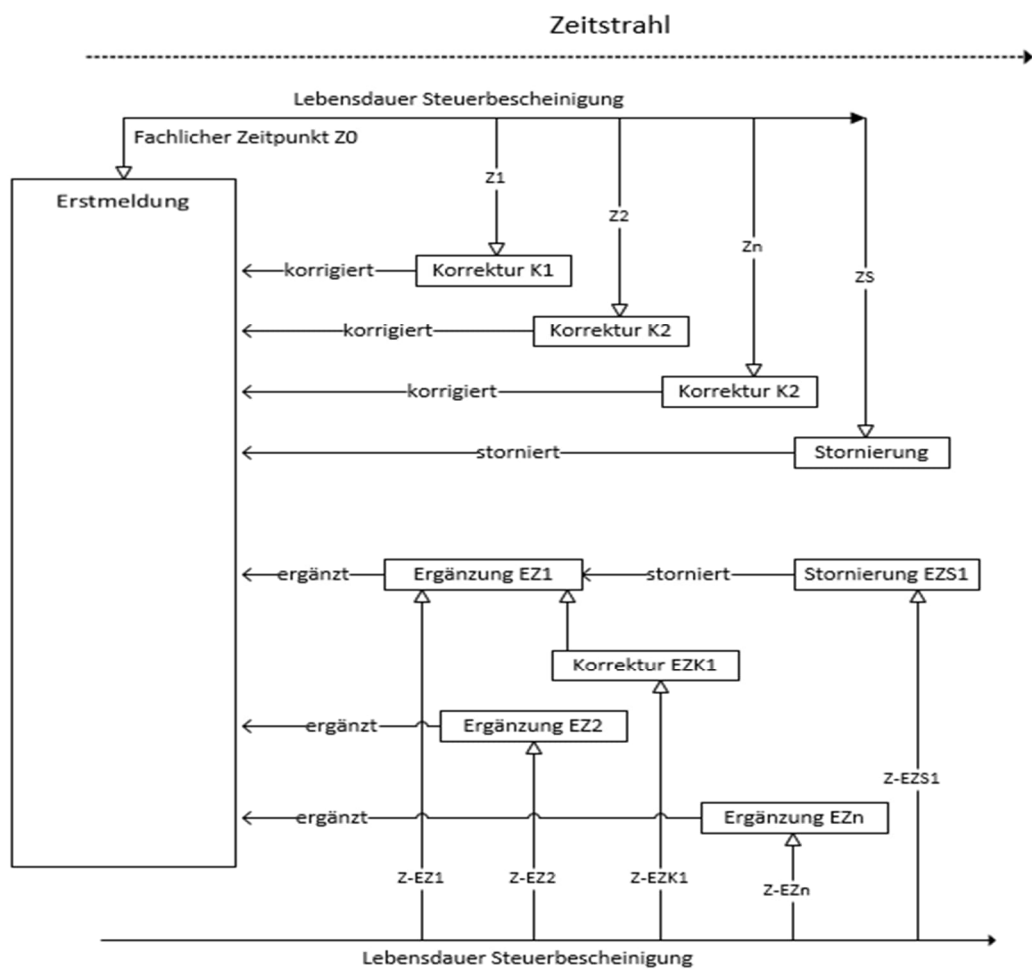

Figure 8: Example of correcting, cancelling of or addition to a report

The two tables below – in line with the diagram – show which report contents are relevant at which point in time and which are no longer relevant. The first table shows the relevant details of a report without supplementary reports.

Time	Relevant content	Irrelevant
Z0	Original report (E)	-
Z1	Correction K1	E
Z2	Correction K2	E + K1
Zn	Correction Kn	E + K1..Kn-1
ZS	Cancellation	E + K1..Kn

Table 1: Relevant reports without additions

As mentioned above, all supplementary reports remain valid as long as the original report has not been cancelled. The table below extends the basic logic to include the supplementary reports shown.

Time	Relevant content	Irrelevant
Z0	Original report (E)	-
Z-EZ1	Original Report (E) + EZ1	-
Z1	Correction K1 + EZ1	E
Z-EZ2	Correction K1 + EZ1 + EZ2	E
Z-EZK1	Correction K1 + EZK1 + EZ 2	E + EZ1
Z2	Correction K2 + EZK1 + EZ2	E + K1 + EZ1
Z-EZn	Correction K2 + EZK1 + EZ2..EZn	E + K1 + EZ1
Zn	Correction Kn + EZK1 + EZ2..EZn	E + K1..Kn-1 + EZ1
Z-EZS1	Correction Kn + EZS1 + EZ2..EZn	E + K1..Kn-1 + EZ1 + EZK1
ZS	Cancellation	E + K1..Kn + EZ1n

Table 2: Relevant reports with additions

5 Personal data

5.1 Natural person

A natural person is defined by their personal data. The mandatory details are the date of birth, last name and first name.

At least one identification identifier must always be provided for a natural person.

5.1.1 Identification identifiers

If the German tax identification number pursuant to Section 139b German Fiscal Code (AO) – IdNr – is known for a natural person, it must be stated.

If no German tax identification number (for a natural person who is not resident in Germany) is known, the tax identification number issued by the country of residence must be provided.

5.2 Non-natural person

A non-natural person is defined by its personal data. The company name is a mandatory field.

An identification identifier must always be provided for a non-natural person.

5.2.1 Identification identifiers

If the German business identification number pursuant to Section 139c AO – W-IdNr – is known for a non-natural person, it must be stated. If the W-IdNr is not known, but the German tax number is available instead, this must be used as the identification identifier when transmitting the data.

If neither the W-IdNr nor the German tax number is known for a non-natural person with limited tax liability, the Legal Entity Identifier (LEI) or the European Unique Identifier (EUID) must be provided.

If the non-natural person does not have a domestic place of business, the tax identification number issued by the country of residence must also be provided.

If the country of residence has not assigned a tax identification number, it is mandatory to provide the legal form and date of incorporation.

5.3 Address

An address can be either a domestic or a foreign address.

5.4 Contact

The report must include contact details for the responsible entity and, where applicable, the service provider. An email address and a telephone number are required.

5.5 MiKaDiv users

MiKaDiv users are non-natural persons who interact with the system in their capacity as a certified financial intermediary, reporting entity or service provider.

5.5.1 Certified financial intermediary

A certified financial intermediary is always a non-natural person. It appears in reports under Section 45b (excluding [9]) EStG.

An institution is considered certified for the purposes of this notification procedure if it holds a process-specific registration number.

An identification identifier is a mandatory field. In the case of a certified financial intermediary, the address, contact details and registration number must also be provided.

5.5.2 Reporting entity

A reporting entity is always a non-natural person. It appears in reports under Section 45c EStG. An identification identifier, as well as the address, contact details and registration number, are mandatory fields.

5.5.3 Service providers

A service provider can only ever be a non-natural-person. An identification identifier, an address, a contact number and the registration number are mandatory details.

5.6 Account holders

An account holder is a natural person or non-natural person with a connection to an account who appears in a report (e.g. creditor, securities account holder, trustee or other representative).

5.6.1 Creditors

The recipient of the capital income may be specified in tax returns, with or without a tax certificate issued, as an individual, as a list of up to two individuals for spouses or life partner, or as another community group (“SonstigeGemeinschaft”) comprising up to ten persons.

Community Groups of two individuals who are not spouses or life partner must be reported as another community group (chapter 5.6.3).

In addition to the mandatory details relating to a natural person or non-natural person, it is mandatory to provide an address.

5.6.2 Securities account holder

The details of a securities account holder should only be provided in reports accompanied by a tax certificate if the creditor is unknown.

In addition to personal details, an address must also be provided.

5.6.3 Another community group

Another community group (“SonstigeGemeinschaft”) is a specific form of a non-natural person in which several natural persons and/or non-natural persons form a (property) association (e.g. a joint ownership or fractional ownership). It consists of at least two and at most ten natural persons and/or non-natural persons.

The personal details and addresses of all co-owners are mandatory.

5.6.4 Representatives

A representative must be specified if an account or securities account is managed on behalf of another account holder, e.g. by a trustee or a person granting a usufruct. Up to five representatives may be listed on a report.

The personal details, an address and the type of securities account (fiduciary account, securities accounts held in usufruct, pledged securities account) must be provided.

A special investment fund with a transparency option is also considered a representative. In this context, the “fiduciary account” (= “Treuhanddepot”) option must always be selected as the account type; see margin note 77 of the Federal Ministry of Finance circular of 22 April 2025 “Individual questions relating data transmission in accordance with Sections 45b and 45c EStG”. Section 45b (2) sentence 1 no. 2 (b) EStG applies accordingly (see chapter 5.2 and chapter 5.2.1, paragraphs 1 and 2). The BZSt tax number of the special investment fund may be provided as an additional optional identifier (in accordance with margin note 13 of the Federal Ministry of Finance circular of 22 April 2025 “Individual questions relating data transmission in accordance with Sections 45b and 45c EStG”).

5.7 Custodians

5.7.1 Custodian

A custodian is an entity that holds securities in custody. It is always a non-natural person.

In addition to personal details, a custodian always has an address. In addition, details of the account number and the type of securities account must be provided for each custodian within the custody chain.

No information is to be provided regarding custodians in the custody chain upstream of the paying agent (see margin note 20 of the Federal Ministry of Finance circular of 22 April 2025 “Individual questions relating data transmission in accordance with Sections 45b and 45c EStG”).

5.7.2 Paying agent

The paying agent is always a non-natural person.

In addition to the personal details, the paying agent always provides an address. In addition, details of the account number and the type of securities account are required.

5.7.3 Investor's custodian

The investor's custodian is an institution that holds and manages the securities. It is always a non-natural person.

In addition to personal details, an investor's custodian always has an address.

The account number of the investor's custodian is provided in the paymentline.

5.7.4 Special feature

If the paying agent is the same as the investor's custodian, this must be indicated in the data set (boolean).

This eliminates the need to enter data twice, as the details of the paying agent are not required (again) in these cases. At the same time, details of a custodian or investor's custodian is not permitted.

5.8 Distributing company

A distributing company is an entity that pays out its profits to its shareholders. It is always a non-natural person.

Only the provision of personal data is mandatory.

5.9 Custodian (of the German shares)

A custodian (of the German shares) is an entity that accepts money, securities or other valuables for safekeeping on behalf of third parties. It is always a non-natural person.

Only the provision of personal data is mandatory.

If the custodian (of the German shares) is the same as the entity required to report, this must be indicated in the data set (boolean). This eliminates the need to enter data twice.

6 Custody chain

Up to 25 custody chain entries can be specified for a custody chain. All domestic and foreign (intermediary) custodians involved must be listed, together with their respective positions.

The first entry in the custody chain is always the domestic paying agent, while the final entry is the investor's custodian. If the paying agent is also the investor's custodian, this must be indicated accordingly (see also chapter 5.7.4).

If an institution acts in several roles within the custody chain, it must be listed multiple times in relation to each respective role within the custody chain. The position in the custody chain must be unique, and must not be specified more than once.

7 Paymentline

The details of a paymentline are based on the combination of the ISIN and the payment date. In addition, paymentline is requesting further information:

7.1 Distributing company

Details of the distributing company must be provided. At the very least, the name of the distributing company must be stated. Other details, such as the address, LEI or EUID, are optional (see margin note 24 of the Federal Ministry of Finance circular of 22 April 2025 "Individual questions relating data transmission in accordance with Sections 45b and 45c EStG").

7.2 Capital income

This includes, amongst other things, details of the gross and net amounts of capital income generated, details of the withholding taxes and solidarity surcharge withheld and paid, the respective tax rates, and the legal basis. Only in cases where a tax certificate has been issued (report type 11) must details of the certified capital income tax and the certified solidarity surcharge also be provided.

7.3 Number of units

The required information regarding the number of units must be provided in accordance with Section 45b (2) No. 5 a) and b) EStG.

When applying the non-objection rule from margin note 8 of the of the Federal Ministry of Finance circular of 22 April 2025 “Individual questions relating to data transmission in accordance with Sections 45b and 45c EStG” the value “0” must be entered.

7.4 Depositary receipts

The details on the depositary receipt provide additional information about the securities held in a securities account.

The domestic investor’s custodian is not required to provide any information in this regard, provided that the non-objection rule regarding the second withholding tax has been applied (see margin note 70 of the Federal Ministry of Finance’s circular of 22 April 2025 “Individual questions relating data transmission in accordance with Sections 45b and 45c EStG”).

7.5 UUID of report containing additional information (ZAM)

If additional details regarding the additions and disposal of securities are to be provided, reference must be made here to the UUID of the report containing additional information (ZAM).

8 Report containing additional information

8.1 Type (of securities trading transacted)

The actual circumstances (as known to the entity required to report) must be reported.

Classification according to margin note 40 of the Federal Ministry of Finance circular of 22 April 2025 “Individual questions relating data transmission in accordance with Sections 45b and 45c

EStG” applies to the circumstances described above.

Examples of this can be taken from margin note 45 and margin note 66 of the Federal Ministry of Finance circular of 22 April 2025 “Individual questions relating data transmission in accordance with Sections 45b and 45c EStG”.

The non-objection rule set out in margin note 39 of the Federal Ministry of Finance circular of 22 April 2025 “Individual questions relating data transmission in accordance with Sections 45b and 45c EStG” permits reporting on a portfolio basis, thereby eliminating the need to allocate securities lending transaction and repo transactions to individual transactions.

The transaction type “Übertrag” (transfer) should be used if the transaction is not a purchase, a sale, a securities lending transaction or a repo transaction. This is a catch-all provision.

Consequently, the “Übertrag” option should also be used when adding or removing units as part of capital measures, or when units are recorded as newly acquired.

9 Response file

This chapter describes the structure and content of a response file.

9.1 Structure

A response file is essentially structured in the same way as a report file (see chapter 3). However, its structure is influenced by whether or not an error or warning was detected while processing the entire file.

This depends on whether it contains information about an error or a warning encountered while processing the entire file, or a list of response records with return codes to identify individual responses.

9.1.1 MiKaDiv_FM_ANTW

MiKaDiv_FM_ANTW has the same structure as MiKaDiv_FM, with the difference that, instead of the report list (“MeldungListe”), it contains either a response list (“AntwortListe”) with an unlimited number of replies or a single reply to the message.

A response to the message is generated if the technical validation of the data reported as XSD-compliant reveals no errors or only a cross-record error.

A response list is generated if individual reports within the message could not be processed successfully. This list then specifies, for each individual report, the reasons why it could not be processed successfully.

9.1.2 Response list

The response list contains all responses to the individual report records that could not be processed successfully.

9.1.2.1 Response

Report data sets are only processed if the message was processed successfully.

If a report data set cannot be processed, a response data set is generated for each report data set. The response data set contains the same UUID as the report data set, making it possible to match them.

The return code indicates that an error has occurred, resulting in the report being rejected. A distinction is made here between general return codes, person type return codes and person-specific return codes.

Reports that have been successfully processed are not included in the response list. Only those reports that could not be processed are returned. Conversely, reports not included in the response list do not contain any errors and have been successfully processed by the system⁴.

9.1.3 Response to the message

The response to the message indicates whether a message has been processed successfully, listing all successfully processed data sets, or whether a cross-data set error has occurred in the message.

A cross-data set error contains information about an error that is not limited to a single transmitted data set, but affects the entire message.

⁴ The exception to this is return code 0403: In these cases, the data set was processed successfully,

In this case, the message response references the original message in the “RefNachrichtUUID” attribute.

Exception:

In the event of a technical error during message transmission, the “RefNachrichtUUID” attribute in the message response is set by default to the value ‘FFFFFFFF-FFFF-5FFF-BFFF-FFFFFFFFFFFF’. This can be caused, for example, by transmission errors or damage to the message during the transmission process, or if the file exceeds the file size limit.

The original message can be identified using the attributes in the DIP header (e.g., "Transferticket-ID"), as a unique identifier.

9.2 Overview of return codes

This section explains the return codes. In the XSD, the fields are not defined as a closed enumeration so that additional return codes can be included, if necessary, without having to modify the XSD.

The type of return code indicates whether the message or the report contains an error or whether the return code is merely an indication.

9.2.1 General return codes

The general return codes currently specified are shown in the table below.

Rule: Any general return code other than “00 – Erfolgreiche Verarbeitung” (successful processing) indicates that the message or report is incorrect and could not be processed.

RC	Art	Titel	Description
00	Hinweis	Erfolgreiche Verarbeitung	The message or report has been processed successfully.
01	Fehler	Meldejahr liegt in der Zukunft	Reports may only be submitted for the current or previous reporting year. If the reporting year is in the future, the report will be rejected.

02	Fehler	Meldejahr ist nicht zulässig	Reports can be submitted from the 2027 reporting year at the earliest. Deliveries relating to previous reporting years will be rejected.
03	Fehler	Initiale Lieferung ist nicht zulässig	There is no initial report for this report (correction, cancellation, addition).
04	Fehler	Fehler bei Personendaten	The verification of personal data has failed. The exact error is listed in the user-specific return codes.
07	Fehler	Identische Kontoperson	At least two account holders could be clearly identified as being the same person. The check is based on the currently valid ID number, which – in the event of decommissioning – may differ from the ID number specified in the report.
08	Fehler	Zeitstempel der Meldung lag zum Zeitpunkt des Nachrichteneingangs in der Zukunft	Reports can only be submitted in the past, but not in the future. The notification's receipt timestamp is used as a reference for verification. This check also ensures that reports can always be corrected or cancelled and do not become irreparable due to an incorrect future timestamp.
11	Fehler	Referenzierte Datenmeldung gehört einer anderen Meldeart an	The referenced data report belongs to a different report type.
12	Fehler	Referenzierte Datenmeldung ist nicht die Erstmeldung	The referenced data report is not the original report.
15	Fehler	Verwahrkette lückenhaft	The position data in the custody chain is not continuous.
17	Fehler	Die angegebenen Personen sind unterschiedlicher Art	The nature of the persons listed varies, but must be consistent (e.g. two creditors).
19	Fehler	Stornierung benötigt amtliche Ordnungsnummer	The cancellation report refers to a notification with an official serial number. This must also be stated when cancelling.
20	Fehler	Referenzierte amtliche Ordnungsnummer invalide	The referenced official serial number is invalid or unknown to the MiKaDiv database.

21	Fehler	Zur Meldung verpflichtetes Institut der Änderung weicht ab	The institution required to report the change is different from the institution required to report the initial notification.
22	Fehler	Keines der ID-Merkmale vorhanden	No identification identifiers have been provided for at least one person. The exact error is listed in the return codes for the person types.
23	Fehler	Meldungs-UUID existiert bereits	The report UUID already exists.
24	Fehler	Nachrichten-UUID existiert bereits	The message UUID already exists.
25	Fehler	Datei zu groß	The file size exceeds the maximum permitted size of 200 MB.
26	Fehler	Hinterlegungsschein darf nicht existieren	The non-objection clause 45b (2) No. 6 applies. In this case, no deposit certificate should be provided.
27	Fehler	Auszahlende Stelle ist depotführende Stelle	Since the paying agent is also the investor's custodian, information regarding the paying agent as well as investor's custodians or custodian is not permitted.
28	Fehler	Fehlendes Datum der Steuerbescheinigung	The date on the tax certificate must be provided for tax residents.
30	Fehler	Angabe ungültiger Hinterlegungsstelle	The "HinterlegungsstelleMelder" is set. In this case, no custodian (of the German shares) must be specified.
31	Fehler	Meldejahr der Korrektur ungültig	The reporting year specified in the correction does not match the reporting year specified in the original report.
32	Fehler	Validierung des XML-Schemas fehlgeschlagen	The content of the data report could not be validated against the current XSD schema.
33	Fehler	Amtliche Ordnungsnummer existiert bereits	The official serial number already exists.
34	Fehler	ISIN und Zahlungstag je Kontonummer nicht eindeutig	The ISIN and the payment date must be unique for each account number within a single report.

35	Fehler	Die Anzahl an zulässigen paymentlines bei Steuerausländern ist überschritten.	Only one paymentline is permitted in a tax return for non-residents.
36	Fehler	ISIN entspricht nicht dem ISO 6166 Standard	The ISIN does not comply with the ISO 6166 standard.
37	Fehler	Länderkürzel Staat entspricht nicht ISO 3166-1 alpha-2 Standard	The country code for the country does not comply with the ISO 3166-1 alpha-2 standard.
38	Fehler	Länderkürzel COAF entspricht nicht ISO 3166-1 alpha-2 Standard	The COAF country code does not comply with the ISO 3166-1 alpha-2 standard.
41	Fehler	Länderkürzel Ansässigkeitsstaat entspricht nicht ISO 3166-1 alpha-2 Standard	The country code for the country of residence does not comply with the ISO 3166-1 alpha-2 standard.
42	Fehler	Länderkürzel EUID entspricht nicht ISO 3166-1 alpha-2 Standard	The EUID country code does not comply with the ISO 3166-1 alpha-2 standard. ⁵
43	Fehler	Fehlende Angaben in Verwahrkette	If the paying agent is not also the investor's custodian, information regarding at least the paying agent and the investor's custodian is required.

Table 3: Overview of general return codes

⁵ For Greece, the country code “EL” (instead of GR) applies, deviating from ISO 3166-1 alpha-2.

9.2.2 Person types and return codes

Person types return codes indicate whether the person types are valid or not.

The return codes currently assigned to the person types are shown in the table below.

RC	Art	Titel	Description
2201	Fehler	Fehler bei Datenübermittler	An error has occurred with at least one data transmitter. This includes certified financial intermediaries or reporting entities, as well as service providers.
2202	Fehler	Fehler in Verwahrstelle	An error has occurred involving at least one person in the custody chain. These include custodians, investor's custodians and paying agents.
2203	Fehler	Fehler in Vertreter	An error has occurred with at least one representative.
2204	Fehler	Fehler in Kontoperson	An error has occurred with at least one account holder.
2205	Fehler	Fehler in Hinterlegungsstelle	An error has occurred at least one custodian (of the German shares).
2206	Fehler	Fehler in ausschüttender Gesellschaft	An error has occurred in at least one distributing company.

Table 4: Overview of person types and return codes

9.2.3 Person-specific return codes

Person-specific return codes indicate whether a person's personal data is valid or not. For each person, exactly one identifying characteristic from the report is specified. If the report contains multiple identifiers for a person, the identifier in the response is selected according to the technical priority (see chapter 5.1.1).

The person-specific return codes currently specified are shown in the table below.

RC	Art	Titel	Description
0402	Fehler	IdNr ist nicht im Bestand	The ID number is not included in the ID number database.
0403	Hinweis	IdNr wurde stillgelegt	In some cases, a person may have been assigned more than one ID number. In such cases, the ID number that was wrongly issued will be deactivated. Note: Processing will be performed under the ID number that remains valid at present.
0404	Fehler	Kombination aus IdNr und Geburtsdatum unbekannt	The identity of the person in question has not been confirmed. We recommend that you check the ID number and personal details (particularly the date of birth).
0409	Fehler	Keine im Produktivsystem zulässige IdNr	An ID number beginning with 0 indicates test data. This is not permitted on the production system

Table 5: Overview of person-specific return codes

10 Checks

Checks are carried out both when reports are submitted and when they are processed; these are described below.

10.1 Delivery

The checks carried out when submissions are received via the DIP bulk data interface can be found in the “Communication DIP Standard”.

10.2 Processing by the MiKaDiv core system

First, cross-data set checks are performed.

If all cross-data set checks on the message have been successful, each individual report data set is checked to see whether it can be processed.

As soon as a check error is detected that prevents the report from being processed, the check is terminated and the report is returned with the appropriate general return code. No further checks will be performed. The possible return codes are listed in chapter 9.2.

Annex 1: List of abbreviations

AO	German Fiscal Code
BMF	Federal Ministry of Finance
BZSt	Federal Central Tax Office (Bundeszentralamt für Steuern)
DIP	Digital inbox
e.g.	for example
EStG	German Income Tax Act
EUID	European Unique Identifier
FVG	Financial Administration Act
IdNr	Identification number
ISIN	International Securities Identification Number
LEI	Legal Entity Identifier
MA	Report type
MB	Megabyte
MeldeartERG	Report type: Supplement
MiKaDiv	Notification procedure regarding capital income taxes on dividends from shares and depositary receipts
RC	Return code
REFOrdnungsnummer	Reference number
RNF	Legal successor
SM-Liste	Cancellation report list
UUID	Universally Unique Identifier
W-IdNr	Business identification number
XML	Extensible Markup Language
XSD	XML Schema Definition
ZAM	Report containing additional information

Annex 2: see separate document
